# *ABOUT DATA INTERPRETATION AND VISUALISATION*

We're living in an increasingly connected world.

Digital innovation drives success,

but innovation is not without risk.

One of the primary roles for accountants to play,

is to identify, measure and record financial data

in accordance with accounting standards.

Data literacy skills will help organisations

to maximise the value from this data set

and to improve the efficiency and effectiveness

of their product and service.

The data literacy skills are very important

for a financial sector.

These skills include the ability to collect,

evaluate and understand data,

to get more insight

and then communicate the insights effectively.

The cyber security threat environment

is dynamic and fast moving,

and it requires constant research and analysis

as well as innovation and automation

of business defence capabilities.

Data security and data governance

is very important for the financial sector.

Both of them show one common goal, protect data.

I think that soft skills like interpersonal skills,

teamwork and leadership,

will become critical for accountants.
